DETAILED ACTION

Response to Arguments

- 1. Applicant's arguments with respect to claims 1-18 (which are rejected by Wang, Gordon, Carnahan, Banerji, and Kato references) have been considered but are moot in view of the new ground(s) of rejection.
- 2. Claims 1-2, 11-14 and 16-18 are still rejected by Wu as follows.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- (e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the

Art Unit: 2613

reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

4. Claims 1-2, 11-14, and 16-23 are rejected under 35 U.S.C. 102(e) as being anticipated by Wu (6,731,684 B1).

Re claims 1, 14, 17 and 18-23, Wu discloses a video compression system (fig. 1 and 2), comprising: means (205 of fig. 1) for grouping video frames that are between consecutive I-frames into a video data set (GOP, or start new GOP includes P and B frames that are between I frame and a next I-frame, see col. 8, lines 5-21; col. 10, lines 1-4); means (116 of fig. 1; 215 and 220 of fig. 2) for splitting the video data set into a plurality of homogeneous files (P or B files); and means (225 of fig. 2; 120-127 of fig. 1) for individually compressing each of the homogeneous files (fig. 3, e.g. each encoder can compresses each P or B file); means (140, 150 of fig. 1) for multiplexing the individually compressed files into a bit stream.

Re claim 2, Wu further discloses wherein the video frames include P-frames and B-frames (col. 4).

Re claim 11, Wu further discloses wherein said compressing includes bit plane encoding quantized transform coefficients obtained from the video data set (note each MPEG-ENCODER inherently encodes each filed in bit plane encoding quantized transform coefficients).

Re claim 12, Wu further discloses wherein said compressing includes performing a runlength encoding of bit planed encoded coefficients (MPEG encoder inherently has VLC).

Re claim 13, Wu further discloses wherein said homogeneous files have similar statistical properties (Each Video comprises GOP including I, P, B; which are similar statistical properties).

Art Unit: 2613

Re claim 16, Wu further discloses a computer-readable medium (160, 165 of fig. 1) bearing instructions for compressing video, said instructions being arranged, upon execution by one or more processors, to perform the steps of the methods.

Claim Rejections - 35 USC § 103

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 6. Claims 3-5 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wu (6,731,684 B1) in view of Carnahan (US 5,414,780).

Re claims 3-5, Wu teaches splitting video serial into panels and storing the B components and P components in separate files (Frame Reordering delay 215 of fig. 2) but not include storing mode information of the video data set and motion components that includes storing horizontal components of the video data set and vertical components of the video data set in separate files as claimed.

However, Carnahan teaches storing mode information of the video data set (horizontal and vertical vectors) and motion components NxM horizontal and vertical image data block include vectors) that include storing horizontal components of the video data set and vertical components of the video data set in separate files (col. 3, line 49-col. 4, line 3) and performing a

run-length encoding of bit planed encoded coefficients (col. 11 and 12, note TRANSFORMER (52), QUANTIZER (54), and CODER (56) performs transforming, quantizing and nm-length coding the video data set).

Therefore, taking the teachings of Wu and Carnahan as a whole, it would have been obvious to one of ordinary skill in the art to incorporate the step of storing the mode information and motion components into the separate files (memories) and the transformer, quantize and coder of Carnahan into the encoder of Gordon for the same purpose of run-length coding the transformed, quantized video data set that retrieves from the separate files.

Doing so would provide the quantization process reduces the magnitude or number of bits of each quantized word and the coder circuit to implement coding in an efficient manner.

7. Claims 6, 7, and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wu (6,731,684 B1) in view of to claim 1 and in view of Kato et al. (US 5,719,986).

Re clam Claims 6, 7, and 16, Wu teaches the encoder for encoding the video sequence into the MPEG compliant transport stream using predicted frame information but not include storing mode 3 B- frame components of the video data set and mode 0, 1, and 2 B-frame components of the video data set in separate files and different color components of the video data set in different files as claimed.

However, Kato teaches storing mode 3 B- frame components of the video data set (61 of fig. 3, note intra prediction for B-frame and mode 0, 1, and 2 B-frame components (14, 23 of fig. 3, note forward prediction, backward prediction, and bi-directional prediction) of the video data

set in separate files and storing different color components of the video data set in different files

(12 of fig. 3, see also fig. 5C, note Y, Cb and Cr are different color components).

Taking the teachings of Gordon and Kato as a whole, it would have been obvious to one of ordinary skill in the art to incorporate the teachings intra-prediction mode for B- frame having forward, backward, and bi-directional prediction of Kato into the encoder of Wu to improve efficiency of encoding. Doing so would provide to a decoder a higher quality image.

8. Claims 8 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wu (6,731,684 B1) in view of to claim 1, and further in view of Weinberger et al (US 5,680,129).

Re claims 8 and 16, Wu fails particularly teach mapping negative values in one of the homogeneous files into positive values, and file header as claimed.

However, Weinberger teaches mapping negative values in one of the homogeneous files into positive values (col. 15, lines 59-64), and file header. Therefore, taking the teachings of Wu and Weinberger as a whole, it would have been obvious to one of ordinary skill in the art to modify the technique of mapping negative values into one of homogeneous files into positive values into the encoder of Gordon to improve performance of encoding color image. Doing so would result in a more efficient compression of the image.

9. Claims 9 and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wu (6,731,684 B1) in view of to claim 1 and in view of Moroney et al. (US 5,771,239).

Re claims 9 and 10, Wu does not particularly teach applying a grammar based code and a YK algorithm as claimed. However, Moroney teaches the MPEG coding technique uses a

Art Unit: 2613

formal grammar ("syntax") and a set of semantic rules for the construction of bitstreams to be transmitted, wherein the grammar encoding would obviously have YK algorithm to encode the homogeneous files. Therefore, taking the combined teachings of Moroney and Wu as a whole, it would have been obvious to one of ordinary skill in the art to incorporate the teachings of Moroney into the method of Wu to improve coding efficiency.

Conclusion

10. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Liu et al. (US 6,731,685) discloses a method and apparatus for determining a bit rate need parameter in a statistical multiplexer.

Contact Information

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tung Vo whose telephone number is 571-272-7340. The examiner can normally be reached on Monday-Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Chris. Kelley can be reached on 571-272-7331. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
